Propagation

Mid-April propagation was not kind to DXers. The continuing low levels of solar activity combined with a active geomagnetic field to produce below-average conditions, sometimes downright terrible.

The good news is that the geomagnetic field is expected to stabilize, reducing absorption and multi-pathing. The bad news is that the sun is expected to remain essentially spotless, as it has been for the past few months. Let's all hope this really is the bottom of the sunspot cycle, as most experts agree, and that we'll begin to see an increase in solar flux before the end of the year.

Meanwhile, DXers should try 20 meters during daylight hours, with a ear on 17 meters for possible openings. Both 30 and 40 meters are useful at night. East coast stations continue to enjoy an evening opening into Africa, while west coasters work Africa on the long path on 40 meters at local dawn. There is DX out there; you simply have to dig deeper into the noise to find it. Good hunting!
